PHAN VAN TINH

AI Trainee Candidate

0344769469 tinh2004.it@gmail.com github.com/Tinh2k4itc Ha Bang, Ha Noi

EDUCATION

Phenikaa University 2022 - 2026 (Expected)

Software Engineering

- Expected GPA: 3.0/4
- Relevant Coursework: Data Structures and Algorithms, Object-Oriented Programming, Database Management, Computer Vision.
- Status: Final-year student; completed all core courses; available for full-time internship.

TECHNICAL SKILLS

- **Backend:** Java Spring, .Net, Python, Dart.
- **Frontend**: Reactjs, Typescript, Angular, Flutter.
- **Database:** MySQL, Firebase.
- **Tools & DevOps:** Git, Docker, Postman.

WORK EXPERIENCE

FPT Software Jan 2026 - Present

INTERN BRSE KOREA

Practice professional Agile/Scrum workflows combined with the TOPIK exam review roadmap to improve document processing and technical communication skills.

ITSUPRO Investment and Development Joint Stock Company Nov 2024 - April 2025

Intern

- Participate in evaluating and testing new features to ensure web compatibility with existing features.
- Work closely with programmers and customers to meet project requirements, goals and desired functionality.
- Develop and integrate custom themes into WordPress, PHP-Fusion and Concrete5.
- Conduct training for customers on how to handle website content management systems.
- Enable site-wide advertising by programming HTML5 canvases to animate web-based elements.

KEY PROJECT

AI-Powered Korean Essay Evaluation System for TOPIK II Exam **Research Project (2 members)** Sep 2025 - Mar 2025

Role: Backend and Fontend Developer

- **Tech Stack:** Python, FastAPI, React 18, TypeScript, Vite, Tailwind CSS, Firebase (Auth, Firestore), PyTorch, KoBERT, EasyOCR, OpenCV, Google Gemini API, i18next.
- **Custom OCR Pipeline for Handwritten Korean:** Built an end-to-end OCR pipeline for recognizing handwritten Korean on Won-go-ji grid paper — including perspective correction, HSV-based ink extraction, Otsu binarization, grid detection via projection histogram, and cell normalization. Achieved **82.25% accuracy** on a 13,584-sample validation set across **11,170 syllable classes**.
- **Hybrid AI Scoring Engine:** Designed a multi-criteria essay scoring system combining a fine-tuned **KoBERT** model for semantic similarity, **rule-based** grammar/structure analysis (with configurable rubrics, topic keyword profiles, and essay templates), and **Google Gemini** as an LLM reviewer — using a weighted fusion formula (65% rule-based + 35% Gemini) to produce detailed per-sentence feedback.
- **Deep Learning Model Training:** Fine-tuned a CNN-based Korean syllable classifier (KoreanCharClassifier) on **135,840 handwriting samples** with 11,170 output classes, trained on Google Colab with CUDA. Implemented a hybrid OCR fallback strategy combining the fine-tuned model with EasyOCR for improved robustness.

- **Full-Stack Web Application:** Developed a responsive React/TypeScript frontend with multi-language support (i18next), Firebase authentication, practice history tracking, sample exam library, admin dashboard, and Dark/Light theme engine. Built a FastAPI backend with clean MVC architecture (controllers, services, repositories, schemas, mappers).
- **Performance Optimization:** Improved image processing pipeline speed by **41.1%** (from 450ms to 265ms per image). The scoring system achieved **80% grade-level accuracy**, **100% off-topic/plagiarism detection**, and maintained correct quality ranking across all test essays.
- **Achievement:** Awarded **2nd Prize** at Faculty-level Scientific Research Competition, recognized as a **"High Applicability Project"**. Selected to advance and compete at the **University-level** competition.
- **Supervised by:** Dr. Nguyen Thi Thuy Lien — Phenikaa University, School of Information Technology.

Decentralized Degree Verification System (DApp) **Personal Project** Oct 2025 - Nov 2025

Role: Backend Developer

- **Tech Stack:** Solidity, TypeScript, Hardhat, Viem, Blockchain (Celo/Ethereum).
- **Privacy-Preserving Architecture:** Engineered a secure verification model using Keccak256 cryptographic hashing to protect student data while ensuring 100% authenticity on-chain.
- **Role-Based Access Control (RBAC):** Implemented strict administrative protocols for diploma issuance combined with a public, permissionless verification interface for third-party stakeholders.
- **Modern Tech Stack Integration:** Leveraged TypeScript, Viem, and Hardhat to build a high-performance, type-safe interaction layer for the blockchain.
- **Comprehensive Quality Assurance:** Developed an extensive automated unit testing suite to validate critical business logic, including duplicate prevention and unauthorized access mitigation.
- **Multi-Chain Deployment & Security:** Orchestrated complex deployment workflows for Celo (Alfajores/Mainnet) and Ethereum (Sepolia), utilizing secure keystore management for private key protection.
- **Github link:** https://github.com/Tinh2k4itc/BlockchainCelo

Online Examination & Learning Management System (QuizSpark) **Team Project (2 member)** May 2025 - July 2025

Role: Fullstatck Developer

- **Tech Stack:** Java 17, Spring Boot, React, Firebase (Realtime DB, Firestore, Auth), Maven, RESTful API.
- Automated Grading & Real-time Sync: Built a real-time grading engine supporting multiple question formats (MCQ, Fill-in-the-blank, Matching) with Firebase Realtime Database for instant push notifications and live UI updates.
- Admin Dashboard: Developed analytics tools for performance tracking with automated Excel/PDF report generation. Deployed on Docker, Vercel, Render.
- **Github link:** https://github.com/Tinh2k4itc/ExamManagementSystem
- **Demo link:** https://doanliennganh.vercel.app
